ARM Templates

JSON & EXPRESSIONS

ARM Template

... structure of an **Azure Resource Manager template**.

The template consists of **JSON** and expressions that you can use to construct values for your deployment.

sources: <https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-authoring-templates>
<https://docs.microsoft.com/en-us/azure/templates/> (Reference Guide!)

JavaScript Object Notation (JSON)

Syntax rules

- data is in **name/value pairs**

A name/value pair consists of a field name (in double quotes), followed by a colon, followed by a value:

Example

```
"name": "John"
```

JavaScript Object Notation (JSON)

Syntax rules

- data is separated by **commas**

Example

```
{  
  "employee":{ "name":"John", "age":30, "city":"New York" }  
}
```

JavaScript Object Notation (JSON)

Syntax rules

- curly braces {} hold **objects**

Example

```
{  
  "employee":{ "name":"John", "age":30, "city":"New York" }  
}
```

JavaScript Object Notation (JSON)

Syntax rules

- square brackets `[]` hold **arrays**

Example

```
[ "Ford", "BMW", "Fiat" ]
```

JavaScript Object Notation (JSON)

Nested Arrays in JSON Objects

Values in an array can also be another array, or even another JSON object:

Example

```
myObj = {  
  "name": "John",  
  "age": 30,  
  "cars": [  
    { "name": "Ford", "models": [ "Fiesta", "Focus", "Mustang" ] },  
    { "name": "BMW", "models": [ "320", "X3", "X5" ] },  
    { "name": "Fiat", "models": [ "500", "Panda" ] }  
  ]  
}
```

ARM Template

Template format

In its simplest structure, a template has the following elements:

```
JSON Copy
```

```
{
  "$schema": "http://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion": "",
  "parameters": { },
  "variables": { },
  "functions": [ ],
  "resources": [ ],
  "outputs": { }
}
```

sources: <https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-authoring-templates>
<https://docs.microsoft.com/en-us/azure/templates/> (Reference Guide!)

ARM Template

```
1 {
2   "$schema": "http://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
3   "contentVersion": "",
4   "parameters": {
5     "<parameter-name>" : {
6       "type": "<type-of-parameter-value>",
7       "defaultValue": "<default-value-of-parameter>",
8       "allowedValues": [ "<array-of-allowed-values>" ],
9       "minValue": <minimum-value-for-int>,
10      "maxValue": <maximum-value-for-int>,
11      "minLength": <minimum-length-for-string-or-array>,
12      "maxLength": <maximum-length-for-string-or-array-parameters>,
13      "metadata": {
14        "description": "<description-of-the parameter>"
15      }
16    },
17    "variables": {

Microsoft.Network/networkInterfaces template reference

📅 09/26/2018 • ⌚ 22 minutes to read • Contributors 🧑

API Version: 2018-08-01

Template format

To create a Microsoft.Network/networkInterfaces resource, add the following JSON to the resources section of your template.

JSON

📋 Copy

```
{
  "name": "string",
  "type": "Microsoft.Network/networkInterfaces",
  "apiVersion": "2018-08-01",
  "location": "string",
  "tags": {},
  "properties": {
    "virtualMachine": {
      "id": "string"
    },
    "networkSecurityGroup": {
      "id": "string",
      "location": "string",
      "tags": {},
      "properties": {
        "securityRules": [
```

NetworkInterfaceIPConfigurationPropertiesFormat object

Name	Type	Required	Value
privateIPAddress	string	No	Private IP address of the IP configuration.
privateIPAllocationMethod	enum	No	Defines how a private IP address is assigned. Possible values are: 'Static' and 'Dynamic'. - Static or Dynamic
privateIPAddressVersion	enum	No	Available from Api-Version 2016-03-30 onwards, it represents whether the specific ipconfiguration is IPv4 or IPv6. Default is taken as IPv4. Possible values are: 'IPv4' and 'IPv6'. - IPv4 or IPv6
subnet	object	No	Subnet bound to the IP configuration. - Subnet object
primary	boolean	No	Gets whether this is a primary customer address on the network interface.
publicIPAddress	object	No	Public IP address bound to the IP configuration. - PublicIPAddress object
applicationSecurityGroups	array	No	Application security groups in which the IP configuration is included. - ApplicationSecurityGroup object

AZURE POWERSHELL MODULE

Az

Install the Azure PowerShell module

12/13/2018 • 4 minutes to read • Contributors

COGNITION

This article tells you how to install the Azure PowerShell modules using PowerShellGet. These instructions work on Windows, macOS, and Linux platforms. For the Az module, currently no other installation methods are supported.

Requirements

Azure PowerShell works with PowerShell 5.1 or higher on Windows, or PowerShell Core 6.x and later on all platforms. If you aren't sure if you have PowerShell, or are on macOS or Linux, [install the latest version of PowerShell Core](#).

Install the Azure PowerShell module

```
PS C:\Users\hwadmin> Install-Module -Name Az
PS C:\Users\hwadmin> Get-InstalledModule -Name Az
```

Version	Name	Repository	Description
2.1.0	Az	PSGallery	Microsoft Azure PowerShell - Cmdlets to manage resources in Azure. This module is compatible with WindowsPowerShell and PowerShell Core....

```
PS C:\Users\hwadmin>
```

PowerShell, run the following command in an elevated session (Run as Administrator on Windows, or with superuser privileges on macOS or Linux):

PowerShell

Copy

Try It

```
Install-Module -Name Az -AllowClobber
```

If you don't have access to administrator privileges, you can install for the current user by adding the `-Scope` argument.

PowerShell

Copy

Try It

```
Install-Module -Name Az -AllowClobber -Scope CurrentUser
```

sources: <https://docs.microsoft.com/en-us/powershell/azure/install-az-ps?view=azps-2.2.0>
